## GLUCAGON ANTAGONISTS/INVERSE AGONISTS

### Field of the invention

- 5 The present invention relates to agents that act to antagonize the action of the glucagon peptide hormone. It relates particularly to non-peptide glucagon antagonists or inverse agonists.

### Background of the invention

- 10 Glucagon is a key hormonal agent that, in cooperation with insulin, mediates homeostatic regulation of the amount of glucose in the blood. Glucagon primarily acts by stimulating certain cells (mostly liver cells) to release glucose when blood glucose levels fall. The action of glucagon is opposed by insulin which stimulates cells to take up and store glucose whenever blood glucose levels rise. Both glucagon and insulin are peptide hormones.

- 15 Glucagon is produced in the alpha islet cells and insulin in the beta islet cells of the pancreas. Diabetes mellitus, the common disorder of glucose metabolism, is characterized by hyperglycemia, and can present as type I, insulin-dependent, or type II, a form that is non-insulin-dependent in character. Subjects with type I diabetes are hyperglycemic and hypoinsulinemic, and the conventional treatment for this form of the disease is to provide insulin. However, in some patients with type I or II diabetes, absolute or relative elevated glucagon levels have been shown to contribute to the hyperglycemic state. Both in healthy animals as well as in animal models of type I and II, removal of circulating glucagon with selective and specific antibodies has resulted in reduction of the glycemic level (Brand et al. Diabetologia 37, 985 (1994);  
20 Diabetes 43, [suppl 1], 172A (1994); Am J Physiol 269, E469-E477 (1995); Diabetes 44 [suppl 1], 134A (1995); Diabetes 45, 1076 (1996)). These studies suggest that glucagon suppression or an action antagonistic to glucagon could be a useful adjunct to conventional antihyperglycemia treatment of diabetes. The action of glucagon can be suppressed by providing an antagonist or an inverse agonist, substances that inhibit or prevent glucagon induced response.  
25 The antagonist can be peptide or non-peptide in nature. Native glucagon is a 29 amino acid-containing peptide having the sequence:
- 30

His-Ser-Glu-Gly-Thr-Phe-Thr-Ser-Asp-Tyr-Ser-Lys-Tyr-Leu-Asp-Ser-Arg-Arg-Ala-Gln-Asp-Phe-Val-Gln-Trp-Leu-Met-Asn-Thr-NH<sub>2</sub>.

- 5 Glucagon exerts its action by binding to and activating its receptor, which is part of the Glucagon-Secretin branch of the 7-transmembrane G-protein coupled receptor family (Jelinek et al. Science 259, 1614, (1993)). The receptor functions by activation of the adenylyl cyclase second messenger system and the result is an increase in cAMP levels.
- 10 Several publications disclose peptide antagonists. Probably, the most thoroughly characterized antagonist is DesHis<sup>1</sup>[Glu<sup>9</sup>]-glucagon amide (Unson et al., Peptides 10, 1171 (1989); Post et al., Proc. Natl. Acad. Sci. USA 90, 1662 (1993)). Other antagonists are eg DesHis<sup>1</sup>,Phe<sup>6</sup>[Glu<sup>9</sup>]-glucagon amide (Azizh et al., Bioorganic & Medicinal Chem. Lett. 16, 1849 (1995)) or NLeu<sup>9</sup>,Ala<sup>11,16</sup>-glucagon amide (Unson et al., J. Biol. Chem. 269(17), 12548
- 15 (1994)).

- Peptide antagonists of peptide hormones are often quite potent; however, they are defective as drugs because of degradation by physiological enzymes, and poor biodistribution. Therefore, non-peptide antagonists of the peptide hormones are preferred. Among the non-peptide glucagon antagonists, a quinoxaline derivative, (2-styryl-3-[3-(dimethylamino)propylmethyl-
- 20 amino]-6,7-dichloroquinoxaline was found to displace glucagon from the rat liver receptor (Collins, J.L. et al. (1992) Bioorganic and Medicinal Chemistry Letters 2(9):915-918). West, R.R. et al. (1994), WO 94/14426 discloses use of skyrin, a natural product comprising a pair of linked 9,10-anthracenedione groups, and its synthetic analogues, as glucagon antagonists.
- 25 Anderson, P.L., U.S. Patent No. 4,359,474 discloses the glucagon antagonistic properties of 1-phenyl pyrazole derivatives. Barcza, S., U.S. Patent No. 4,374,130, discloses substituted disilacyclohexanes as glucagon antagonists. WO 98/04528 (Bayer Corporation) discloses substituted pyridines and biphenyls as glucagon antagonists. Furthermore, WO 97/16442 (Merck & Co., Inc.) discloses substituted pyridyl pyrroles as glucagon antagonists and WO 98/21957
- 30 (Merck & Co., Inc.) discloses 2,4-diaryl-5-pyridylimidazoles as glucagon antagonists. These glucagon antagonists differ structurally from the present compounds.

## EXPERIMENTAL

### 5 Glucagon binding:

In the following section binding assays as well as functional assays useful for evaluating the efficacy of the compounds of the invention are described.

#### Glucagon Binding Assay (I)

10 Binding of compounds to the glucagon receptor was determined in a competition binding assay using the cloned human glucagon receptor.

In the screening setup, antagonism was determined as the ability of the compounds to inhibit the amount of cAMP formed in the presence of 5 nM glucagon.

15

For full characterization, antagonism was determined in a functional assay, measured as the ability of the compounds to right-shift the glucagon dose-response curve. Using at least 3 different antagonist concentrations, the  $K_i$  was calculated from a Schild plot.

Receptor binding was assayed using cloned human receptor (Lok et al, Gene 140, 203-209 (1994)). The receptor inserted in the pLJ6' expression vector using EcoRI/SS1 restriction sites (Lok et al) was expressed in a baby hamster kidney cell line (A3 BHK 570-25). Clones were selected in the presence of 0.5 mg/ml G-418 and were shown to be stable for more than 40 passages. The  $K_d$  was shown to be 0.1 nM.

25 Plasma membranes were prepared by growing cells to confluence, detaching them from the surface and resuspending the cells in cold buffer (10 mM tris/HCl), pH 7.4 containing 30 mM NaCl, 1 mM dithiothreitol, 5 mg/l leupeptin (Sigma), 5 mg/l pepstatin (Sigma), 100 mg/l bacitracin (Sigma) and 15 mg/l recombinant aprotinin (Novo Nordisk)), homogenization by two 10-s bursts using a Polytron PT 10-35 homogenizer (Kinematica), and centrifugation upon a layer of  
30 41 w/v% sucrose at 95.000 \* g for 75 min. The white band located between the two layers was

123

diluted in buffer and centrifuged at  $40.000 \times g$  for 45 min. The precipitate containing the plasma membranes was suspended in buffer and stored at  $-80^{\circ}\text{C}$  until required.

5 Glucagon was iodinated according to the chloramine T method (Hunter and Greenwood, Nature 194, 495 (1962)) and purified using anion exchange chromatography (Jørgensen et al, Hormone and Metab. Res. 4, 223-224 (1972). The specific activity was  $460 \mu\text{Ci}/\mu\text{g}$  on day of iodination. Tracer was stored at  $-18^{\circ}\text{C}$  in aliquots and were used immediately after thawing.

Binding assays were carried out in triplicate in filter microtiter plates (MADV N65, Millipore).  
10 The buffer used in this assay was 25 mM HEPES pH 7.4 containing 0.1% human serum albumin (Sigma, grade V). Glucagon was dissolved in 0.05 M HCl, added equal amounts(w/w) of HSA and freeze-dried. On the day of use, it was dissolved in water and diluted in buffer to the desired concentrations.  
175  $\mu\text{l}$  of sample (glucagon or test compounds) was added to each well. Tracer (50.000 cpm)  
15 was diluted in buffer and 15  $\mu\text{l}$  was added to each well. 0.5  $\mu\text{g}$  freshly thawed plasma membrane protein diluted in buffer was then added in 15  $\mu\text{l}$  to each well. Plates were incubated at  $25^{\circ}\text{C}$  for 2 hours. Non specific binding was determined with  $10^{-6}$  M glucagon. Bound and unbound tracer were then separated by vacuum filtration (Millipore vacuum manifold). The plates were washed once with 150  $\mu\text{l}$  buffer/ well. The plates were air dried for a couple of hours,  
20 whereafter filters were separated from the plates using a Millipore Puncher. The filters were counted in a  $\gamma$  counter.

#### Functional Assay (I)

The functional assay was carried out in 96 well microtiter plates (tissue culture plates, Nunc).  
25 The resulting buffer concentrations in the assay were 50 mM tris/HCl, 1 mM EGTA, 1.5 mM  $\text{MgSO}_4$ , 1.7 mM ATP, 20  $\mu\text{M}$  GTP, 2 mM IBMX, 0.02% tween-20 and 0.1% HSA. pH was 7.4. Glucagon and proposed antagonist were added in 35  $\mu\text{l}$  diluted in 50 mM tris/HCl, 1 mM EGTA, 1.85 mM  $\text{MgSO}_4$ , 0.0222 % tween-20 and 0.111 % HSA, pH 7.4. 20  $\mu\text{l}$  of 50 mM tris/HCl, 1 mM EGTA, 1.5 mM  $\text{MgSO}_4$ , 11.8 mM ATP, 0.14 mM GTP, 14 mM iso-buthyl-methyl-xanthine (IBMX) and 0.1% HSA, pH 7.4 was added. GTP was dissolved immediately before  
30 the assay.

124

50  $\mu$ l containing 5  $\mu$ g plasma membrane protein was added in a tris/HCl, EGTA,  $\text{MgSO}_4$ , HSA buffer (the actual concentrations were dependent upon the concentration of protein in the stored plasma membranes).

- 5 The total assay volume was 140  $\mu$ l. The assay was incubated for 2 hours at 37°C with continuous shaking. Reaction was terminated by addition of 25  $\mu$ l 0.5 N HCl. cAMP was measured by the use of a scintillation proximity kit (Amersham).

#### Glucagon Binding Assay (II)

- 10 Receptor binding was assayed using the cloned human receptor (Lok et al, Gene 140, 203-209 (1994)). The receptor inserted in the pLJ6' expression vector using EcoRI/SstI restriction sites (Lok et al) was expressed in a baby hamster kidney cell line (A3 BHK 570-25). Clones were selected in the presence of 0.5 mg/ml G-418 and were shown to be stable for more than 40 passages. The  $K_d$  was shown to be 0.1 nM.

15

- Plasma membranes were prepared by growing cells to confluence, detaching them from the surface and resuspending the cells in cold buffer (10 mM tris/HCl), pH 7.4 containing 30 mM NaCl, 1 mM dithiothreitol, 5 mg/l leupeptin (Sigma), 5 mg/l pepstatin (Sigma), 100 mg/l bacitracin (Sigma) and 15 mg/l recombinant aprotinin (Novo Nordisk)), homogenization by two 10-s bursts using a Polytron PT 10-35 homogenizer (Kinematica), and centrifugation. The homogenate was resuspended and centrifuged again. The final precipitate containing the plasma membranes was suspended in buffer and stored at -80°C until required.

- Binding assays were carried out in duplicate in polypropylene tubes or microtiter plates. The buffer used in this assay was 25 mM HEPES pH 7.4 containing 0.1% bovine serum albumin (Sigma, fraction V). Sample (glucagon (Bachem CA) or test compounds) was added to each tube or well. Tracer (~ 25000 cpm) was diluted in buffer and was added to each tube or well. 0.5  $\mu$ g freshly thawed plasma membrane protein diluted in buffer was then added in aliquots to each tube or well. Tubes or plates were incubated at 37°C for 1 hour. Non specific binding was determined with  $10^{-7}$  M glucagon. Bound and unbound tracer were then separated by vacuum filtration (Brandel). The tubes or wells were washed twice with buffer. The filters or plates were counted in a gamma counter.

Functional Assay (II)

The functional assay determined the ability of the compounds to antagonize glucagon-stimulated formation of cAMP in a whole-cell assay. The assay was carried out in borosilicate glass 12 x 75 tubes. The buffer concentrations in the assay were 10 mM HEPES, 1 mM EGTA, 5 1.4 mM MgCl<sub>2</sub>, 0.1 mM IBMX, 30 mM NaCl, 4.7 mM KCl, 2.5 mM NaH<sub>2</sub>PO<sub>4</sub>, 3mM glucose and 0.2% BSA. The pH was 7.4. Loose whole cells (0.5 ml, 10<sup>6</sup>/ml) were pretreated with various concentrations of compounds for 10 min at 37°C, then challenged with glucagon for 20 min. Some aliquots (500 µL) of cells were treated with test compounds (55 uL) alone to test for 10 agonist activity. The reactions were terminated by centrifugation, followed by cell lysis with the addition of 500 µl 0.1% HCl. Cellular debris was pelleted and the supernatant containing cAMP evaporated to dryness. cAMP was measured by the use of an RIA kit (NEN, NEK-033). Some assays were carried out utilizing the adenylate cyclase FlashPlate system from NEN.

Synthesis methods

The following synthesis protocols refer to intermediate compounds and final products identified in the specification and in the synthetic schemes. The preparation of the compounds of the present invention is described in detail using the following examples, but the chemical reactions described are disclosed in terms of their general applicability to the preparation of the glucagon antagonists of the invention. Occasionally, the reaction may not be applicable as described to each compound included within the disclosed scope of the invention. The compounds for which this occurs will be readily recognized by those skilled in the art. In all such cases, either the reactions can be successfully performed by conventional modifications known to those skilled in the art, that is, by appropriate protection of interfering groups, by changing to other conventional reagents, or by routine modification of reaction conditions. Alternatively, other reactions disclosed herein or otherwise conventional will be applicable to the preparation of the corresponding compounds of the invention. In all preparative methods, all starting materials are known or readily preparable from known starting materials. All temperatures are set forth in degrees Celsius and unless otherwise indicated, all parts and percentages are by weight when referring to yields and all parts are by volume when referring to solvents and eluents.

General procedures for the preparation of alkylidene hydrazides:

The compounds of general formula I may be prepared according to one embodiment of the invention, the alkylidene hydrazides of general formula II, as indicated in Scheme I, that is, by  
 5 converting an ester of a carboxylic acid, for example, an aromatic acid to a hydrazide derivative and further reacting that product compound with a substituted aldehyde or ketone to yield a substituted alkylidene hydrazide.

SCHEME I

wherein A, B, K, D, m, n and R<sup>4</sup> are as defined for formula I and R<sup>a</sup> is lower alkyl.

15 General procedure for the synthesis of precursor hydrazides A-(C=O)-NHNH<sub>2</sub>:

The reaction is known (Org. Syn., Coll. Vol. II, A.H. Blatt, ed., John Wiley & Sons, New York, 1943, p. 85; Org. Syn., Coll. Vol. IV, N. Rabjohn, ed., John Wiley & Sons, New York, 1963, p. 819) and is generally performed by stirring the corresponding ester (either methyl, ethyl or other lower alkyl ester) with 2-10 molar excess of hydrazine in the presence of a solvent such  
 20 as ethyl alcohol, methyl alcohol, isopropyl or tert-butyl alcohol or tetrahydrofuran, dioxane, DMSO, ethylene glycol, ethylene glycol dimethyl ester, benzene, toluene or a mixture of the above solvents or, in the absence of a solvent where excess of hydrazine acts as a solvent. The reactions are performed between 0°C to 130°C, preferably between 20°C to 100°C, most preferably at or about the reflux temperature of the solvent. The reactions are preferably conducted under an inert atmosphere such as N<sub>2</sub> or Ar. When the reaction is complete as judged  
 25 by disappearance of the starting ester by TLC or HPLC, the solvent may be removed by concentration at atmospheric or reduced pressure.

The product can be further purified by either recrystallization from a solvent such as ethyl alcohol, methyl alcohol, isopropyl alcohol, toluene, xylene, hexane, tetrahydrofuran, diethyl ether, dibutyl ether, water or a mixture of two or more of the above. Alternatively, the product can be  
5 purified by column chromatography using dichloromethane/methanol or chloroform/methanol or isopropyl alcohol as eluent. The corresponding fractions are concentrated either at atmospheric pressure or in vacuo to provide the pure aroyl hydrazide.

Preparation of aromatic acid hydrazides:

10 The methyl or ethyl ester of the corresponding aromatic acid, such as for example a substituted benzoic acid ester, is dissolved in ethanol and hydrazine (5 eq) is added. The reaction is refluxed overnight under nitrogen. Upon cooling the substituted hydrazide derivative usually precipitates. After filtration the product is usually recrystallized from hot methanol, ethanol or isopropyl alcohol. In cases where the hydrazide does not precipitate, the reaction is concentrated under vacuo and chromatographed over silica gel using dichloromethane/methanol as  
15 the eluent. Specific examples illustrating the preparation of aromatic hydrazides are provided below.

Preparation of 5-hydroxyindole-2-carboxylic acid hydrazide:

20 To a sample of ethyl 5-hydroxyindole-2-carboxylate (5g, 24 mmol), dissolved in ethanol (250 mL) was added hydrazine (4 mL, 121 mmol). The reaction was refluxed overnight under nitrogen. Upon cooling the reaction vessel, the desired product crystallized. The white solid was isolated by filtration. Recrystallization from hot ethanol gave the 5-hydroxyindole-3-carboxylic acid hydrazide in 85% yield.

15 **Preparation of 2-chloro-4-hydroxybenzoic acid hydrazide:**

## Step A:

4-amino-2-chlorobenzoic acid (10 g, 58 mmol) was dissolved in  $\text{H}_2\text{SO}_4$  (12 N, 120 mL) with heating. After cooling the solution in an ice-bath aqueous  $\text{NaNO}_2$  (2.5 M, 25 mL) was added dropwise such that the internal temperature remained at 5 °C. Urea was added to the mixture for after stirring for 15 minutes to destroy excess  $\text{NaNO}_2$  (monitored by starch iodine test).

20

CuSO<sub>4</sub> (100-200 mg) was added and the mixture was heated to 90 °C until evolution of gas stopped. After cooling, the mixture was extracted with ethyl ether (3x). The combined organic fractions were extracted with 3N NaOH (3x). The combined aqueous layer was acidified with conc. HCl and the product was extracted with ethyl ether (3x). The organic fractions  
5 were washed with water, brine, and dried over MgSO<sub>4</sub>. The crude product was introduced into a silica gel column and eluted with ethyl acetate/hexane (1/1) to afford 2-chloro-4-hydroxybenzoic acid.

Step B:

To a solution 2-chloro-4-hydroxybenzoic acid in anhydrous methanol was added thionyl chloride (1.5 eq). After stirring the solution at room temperature for 16 hours, the solvent was evaporated. The residue was taken up in ethyl acetate and washed with saturated aqueous  
15 sodium bicarbonate, water, brine, and dried over MgSO<sub>4</sub> and concentrated in vacuo to give methyl 2-chloro-4-hydroxybenzoate.

Step C:

To a solution of methyl 2-chloro-4-hydroxybenzoate (13.6 g, 73.1 mmol) in acetic acid (300

The residue was taken up in chloroform, washed with water, brine, dried over magnesium sulfate, filtered and concentrated. Methyl 2,3-dichloro-4-hydroxybenzoate precipitated out of ethyl acetate. Chromatography of the residue using ethyl acetate/hexane (1/9 to 3/7) afforded methyl 2,5-dichloro-4-  
25 hydroxybenzoate (1.4 g, 60%) as well as an additional batch of methyl 2,3-dichloro-4-hydroxybenzoate isomer (total of 8.4 g, 10%).

Preparation of 3-cyano-4-hydroxybenzoic acid hydrazide, trifluoroacetate:

## 5 Step A:

Methyl-4-hydroxybenzoate (35.5 g, 0.233 mol) was dissolved in 200 mL of warm (65 °C) acetic acid. A solution of iodine monochloride (37.8 g, 0.233 mol) in 50 mL of acetic acid was added slowly (40 minutes) to the methyl-4-hydroxybenzoate solution, while maintaining a temperature of 65 °C and vigorous stirring. The product crystallizes from solution upon cooling to room temperature and standing overnight. The crystals were collected on a filter, washed with water, then dried under vacuum. Methyl-4-hydroxy-3-iodobenzoate was obtained as white crystals (28.6 g, 44%).

## Step B:

Methyl-4-hydroxy-3-iodobenzoate (2.00 g, 7.2 mmol) was dissolved into 5 mL of dry DMF. Copper(I) cyanide (0.72 g, 8.0 mmol) and a small crystal of sodium cyanide was added. The mixture was flushed with nitrogen, placed in an oil heating bath (100-110 °C), and stirred overnight. TLC indicated nearly complete reaction. The mixture was cooled and the solids removed by filtration. The solids were extracted with DMF (3 mL). The filtrate and washings were taken up in 100 mL of ethyl acetate, then washed with 3 portions of saturated sodium chloride solution. The solids and aqueous washings were combined, and shaken with a

mixture of 50 mL of ethyl acetate and a ferric chloride solution (4 g of hydrated ferric chloride in 7 mL of conc. hydrochloric acid). The ethyl acetate layers were combined, washed with brine containing sodium metabisulfite, dried over sodium sulfate, filtered, and the solvent removed in vacuo. The resulting solids were purified by flash chromatography on silica gel  
5 (20% ethyl acetate/ hexane) to afford methyl-3-cyano-4-hydroxybenzoate, 0.93g (73%).

$^1\text{H}$  NMR (DMSO-  $\text{D}_6$ ):  $\delta$  3.79 (s, 3H), 7.07 (d,  $J$  = 8.7, 1H), 8.02 (dd,  $J$  = 8.7, 1.9, 1H), 8.10 (d,  $J$  = 1.9, 1H).

10 Step C:

Methyl-3-cyano-4-hydroxybenzoate (2.71g, 15.3 mmol) was dissolved in 50 mL of THF. The solution was chilled in an ice bath, and 2.0M potassium hydroxide (17 mL, 34 mmol) was added dropwise. The resulting mixture was stirred at room temperature overnight. TLC indicated complete reaction. The THF was removed by rotary evaporation. The aqueous re-  
15 sidue was acidified with aqueous trifluoroacetic acid and purified by reverse-phase HPLC (C-18, 0.1% TFA in water and acetonitrile). 3-Cyano-4-hydroxybenzoic acid was obtained as a white powder (2.1g, 84%) after lyophilization.

$^1\text{H}$  NMR (DMSO-  $\text{D}_6$ ):  $\delta$  7.09 (d,  $J$  = 9.0, 1H), 8.00 (dd,  $J$  = 9.0, 2.3, 1H), 8.07 (d,  $J$  = 2.3, 1H)  
20 12.50 (br s, 2H); MS (APCI, neg): 162. IR: 2252  $\text{cm}^{-1}$ , CN.

3-Cyano-4-hydroxybenzoic acid (1.88g, 11.5 mmol) was dissolved in 20 mL of methylene chloride/DMF (1/1) and chilled in an ice-bath. Diisopropylethylamine (12 mL, 69 mmol), t-  
25 butyl carbazate (1.76g, 13.3 mmol), and PyBroP (bromo-tris-pyrrolidino-phosphonium hexafluorophosphate, 6g, 12.9 mmol) were added, and the mixture was stirred to form a clear solution. The solution stood in the refrigerator overnight. TLC indicated that the reaction was not complete, so additional diisopropylethylamine (22 mL, 127 mmol), t-butyl carbazate (0.85g, 6.4 mmol) and PyBroP (3.0g, 6.4 mmol) were added. After 8 more hours at 0 °C, the  
30 reaction was worked up as follows. The solution was reduced by rotary evaporation. The remaining DMF solution was diluted with 100 mL of ethyl acetate, and washed with several portions of 0.1 M HCl (until the wash remained acidic to litmus paper). The ethyl acetate layer was further washed with 3 portions of brine, dried over magnesium sulfate, filtered, and

reduced to an oil in vacuo. The oil was purified by chromatography on silica gel (6:4 hexane:ethyl acetate) to afford tert-butyloxycarbonyl (3-cyano-4-hydroxy)benzoic acid hydrazide as a white solid (1.8g, 56%).

- 5  $^1\text{H}$  NMR (DMSO-  $\text{D}_6$ ):  $\delta$  1.42 (s, 9H), 7.09 (d,  $J = 8.7$ , 1H), 7.98 (m, 1H), 8.11 (br s, 1H), 8.92 (s, 1H), 10.15 (s, 1H), 11.73 (br s, 1H); MS (APCI, neg): 276; IR: 2232  $\text{cm}^{-1}$ , CN.

Trifluoroacetic acid was added with stirring, and the resulting solution stood for 4 hours at 0 °C. TLC indicated complete reaction. Solvent and excess TFA were removed by rotary evaporation. The remaining oil was purified by reverse-phase liquid chromatography (Aquasil C-18 column, water/acetonitrile/0.1% TFA). The title compound was obtained as a  
15 white solid (0.24 g, 13%).

$^1\text{H}$  NMR (DMSO-  $\text{D}_6$ ):  $\delta$  7.16 (d,  $J = 9.0$ , 1H), 8.00 (dd,  $J = 1.5$ , 9.0, 1H), 8.14 (d,  $J = 1.5$ , 1H), 10.47 (br s, 5H); MS (APCI, neg): 176.

20 Preparation of 4-hydroxynaphthoic acid hydrazide:

Step A:

- 25 Silver nitrate (17 g, 0.1 mol) was dissolved in water (10 mL) and treated with 1 N NaOH (300 mL, 0.3 mol). The brown precipitate which was formed was stirred for 30 minutes and the supernatant was decanted. The brown silver oxide was washed with additional volumes of water (3x).

To the silver oxide above was added 1N NaOH (150 mL) and 4-hydroxynaphthaldehyde (1 g, 6 mmol)). The mixture was heated to 70 °C for 10 minutes after which additional amounts of 4-hydroxynaphthaldehyde (5.5 g, 32 mmol) was added in portions. The mixture was kept at 80 °C for 16 hours. TLC analysis indicated incomplete conversion. An additional portion of silver oxide was prepared as above and added to the reaction mixture. After heating the mixture for an additional 6 hours, the mixture was cooled and acidified with 1N HCl. The aqueous layer was extracted with ethyl acetate (3x) and upon concentration 4-hydroxynaphthoic acid precipitated (3.7 g, 60%) out of solution.

The organic phase was washed twice with dilute hydrochloric acid, twice with water, dried over  $\text{MgSO}_4$  and then concentrated to give pure product.

**Step B:**

To a solution of chloroacetanilide (or a derivative thereof) (1.2 eq.) and 2-methoxy-4-hydroxy benzaldehyde (or another aromatic aldehyde substituted with a hydroxy group) (1 eq.) in DMSO was added potassium carbonate (1.5 eq.). After stirring overnight at room temperature, 100 ml water was added. The mixture was extracted with ethyl acetate, the organic extracts were washed twice with a satd. sodium bicarbonate solution, twice with water, and dried over  $\text{MgSO}_4$ . After concentration in vacuo, the product was obtained.

The following two aldehydes were prepared as examples of compounds that can be prepared using this methodology:

20 This type of aldehydes can be coupled to hydrazides using the methodology as described in step D to give a compound of formula IXa. Alternatively these compounds can undergo rearrangement by treatment with base as described below (step C), followed by coupling to a hydrazide (step D) to give a compound of formula IXb.

**Step C:**

The mixture was extracted with ethyl acetate, the organic extracts were dried over  $\text{MgSO}_4$ , and concentrated to give the desired product which can be further purified by column chromatography, or used directly for the next step.

Step D:

The resulting carbonyl compounds are treated with the corresponding acylhydrazide in a solvent. The solvent may be one of the following: ethyl alcohol, methyl alcohol, isopropyl alcohol, tert-butyl alcohol, dioxane, tetrahydrofuran, toluene, chlorobenzene, anisole, benzene, chloroform, dichloromethane, DMSO, acetic acid, water or a compatible mixture of two or more of the above solvents. A catalyst such as acetic acid can be added. A dehydrating reagent such as triethylorthoformate can also be added to the reaction mixture. The reaction is performed by stirring the reaction mixture preferably under an inert atmosphere of N<sub>2</sub> or Ar at temperatures between 0°C to 140°C, preferably between 10°C to 80°C. In many cases the product simply crystallizes out when the reaction is completed and is isolated by suction filtration. It can be further recrystallized if necessary from a solvent such as the above described reaction sol-

1-Bromo-4-(2-hydroxyethyl)naphthalene:

To a solution of methyl 4-bromo naphthalene acetate (2.0 g, 7.16 mmol) in anhydrous THF (15 mL) was added drop wise at 0°C 1 M lithium aluminum hydride in THF (4 mL). The mixture was stirred at room temperature for 16 h, diluted with water (5 ml), acidified with conc. hydrochloric acid, and extracted with ethyl acetate (3 x 20 mL). The combined organic extracts were dried (MgSO<sub>4</sub>), and concentrated to provide a 1.71 g (95%) colorless oil (1.71 g, 95%). A similar synthetic reference is described in A. A. Kiprianov, A. Preparation of acylhydrazones of 4-hydroxymethylnaphthaldehyde:

Step A:

The 1,4-Naphthalenedicarboxylic acid (25 g, 116 mmol) was dripped into a mixture of Lithium Aluminum Hydride (15 g, 395 mmol) in 600 mL of anhydrous THF and refluxed for two days. The mixture was cooled in an ice bath and excess LAH was decomposed by the slow addition of methanol followed by ice chips. THF was removed under vacuum and the residue was acidified with 1N HCl. The product was extracted with ethyl acetate (3x), washed with aqueous sodium bicarbonate (3x), water, brine, and dried over magnesium sulfate. 1,4-Bishydroxymethylnaphthalene (70%) was obtained as a solid after evaporation of the solvent and can be used in the subsequent oxidation step without further purification. A portion of the material was purified by column chromatography using hexane/ethyl acetate (80/20 to 75/25) for characterization purposes.

Step B:

To a solution of 1,4-bishydroxymethylnaphthalene (12 g, 65 mmol) in ethyl acetate (300 ml) was added manganese dioxide (28 g, 325 mmol). After stirring for 45 minutes most of the starting material had disappeared and two new spots (mono aldehyde and dialdehyde) were seen on TLC. The upper spot corresponds to the dialdehyde. The mixture was passed through a bed of Celite and eluted with additional volumes of ethyl acetate. The solvent was evaporated and 4-hydroxymethylnaphthaldehyde was purified by column chromatography using hexane/ethyl acetate (80/20 to 75/25) in 50% yield.

The compounds of formula II can also be prepared by parallel synthesis using the protocol mentioned above in a combinatorial approach. Thousands of compounds of formula II can thus  
15 be prepared by this combinatorial approach which can be semi- or fully automated. The automation of this protocol can be performed using solution phase combinatorial chemistry in e.g. a 96 well setup using an automated synthesizer device. In the first step of the synthesis the aldehydes or ketones may be prepared according to Scheme II by a combination of a selected number of aldehydes or ketones with a selected number of alkylating reagents. In the second  
20 step the formed aldehydes/ketones can be combined with a selected number of the hydrazides (which may be synthesized according to Scheme I) thereby generating a predetermined very large number of compounds as single entities.

The synthesized compounds mentioned above are examples of such compounds that can be  
25 prepared using this combinatorial methodology.

By application of the above methodology, the following compounds may also be synthesized:

10 General procedures for the preparation of alkylidene arylsulfonyl hydrazides according to the invention

The compounds of general formula I are prepared according to one embodiment of the invention, the alkylidene arylsulfonyl hydrazides of general formula III, that is, by converting an arylsulfonyl halide, for example chloride or bromide to the corresponding hydrazide derivative and

15 further reacting the product arylsulfonyl hydrazide compound with a substituted aldehydes or ketones to yield alkylidene arylsulfonyl hydrazide derivatives as illustrated in Scheme IV.

SCHEME IV

wherein A, B, K, D, m, n and R<sup>4</sup> are as defined for formula I.

- 5 The synthesis of the arylsulfonylhydrazide precursors is performed by application of general methodology, for example as described by Friedman, L.; Litle, R.L.; Reichle, W. R. in *Org. Synth. Coll. Vol. V*, 1973, 1055-1057, by slowly adding the arylsulfonyl chloride either neat, or in a solution in an inert solvent such as tetrahydrofuran, dimethyl ether, dioxane or diethyl ether to an excess of hydrazine, either neat or in solution in the one of the above solvents or a mixture of these at -20°C to 100°C, preferably between 0°C to 60°C. When the reaction is judged to be completed, the excess of solvent and volatile reagents is removed by distillation either at atmospheric pressure or in vacuo. The residual product can be further purified by recrystallization from a solvent such as methyl alcohol, ethyl alcohol, isopropyl alcohol, water, toluene, acetic acid, dioxane, tetrahydrofuran or a mixture of two or more of the above solvents when compatible.

Alternatively, the product can be purified by column chromatography using dichloromethane/methanol or chloroform/methanol or isopropyl alcohol as eluent. The corresponding fractions are concentrated either at atmospheric pressure or in vacuo to provide the pure arylsulfonyl hydrazide.

By use of the above methodology the following compounds can be prepared:

#### EXAMPLE 161:

25 3-Chloro-4-hydroxybenzenesulfonic acid (benzylidene)hydrazide

3-Chloro-4-hydroxybenzenesulfonyl hydrazide:

A solution of 4.82 g (21.2 mmol) 3-chloro-4-hydroxy-benzenesulfonyl chloride, (prepared according to the procedure described by Popoff, I. C.; Frank, J. R.; Whitaker R. L.; Miller H. J., Demaree K. D. *J. Agr. Food Chem.* 1969, 17, 810.) in 15 ml THF was added dropwise with stirring to 3.4 ml 50% hydrazine hydrate (54.4 mmol, 2.5 eq.) at such a rate that the temperature is maintained below 10°C. A precipitate formed after the addition was completed. The mixture was stirred for an additional 30 min, and cooled to 0°C. The solid was collected in a Büchner funnel, washed several times with distilled water, and air dried. Recrystallization from methanol provided 1.20 g 3-chloro-4-hydroxybenzenesulfonyl hydrazide as a white solid.

<sup>1</sup>H NMR (DMSO-d<sub>6</sub>): δ 4.78 (bs, 4 H), 6.72 (d, J = 8.6 Hz, 1 H), 7.35 (dd, J = 2.3, 8.6 Hz, 1 H), 5.55 (J = 2.2 Hz, 1 H); MS(Cl): m/z 223, 221.

To a solution of 105 mg (0.48 mmol) of the above 3-chloro-4-hydroxybenzenesulfonyl hydrazide in 5 ml methanol was added 0.05 ml (52 mg, 0.49 mmol) benzaldehyde and one drop of acetic acid. After 30 min the mixture was concentrated. Flash chromatography (silica gel, 2:1 hexane/ethylacetate) provided 67 mg (45%) of the title compound as a solid.

<sup>1</sup>H (DMSO-d<sub>6</sub>): δ 7.10 (d, J = 8.6 Hz, 1 H), 7.38 (m, 3 H), 7.55 (dd, J = 2.3, 6.0 Hz, 2 H), 7.66 (d, J = 2.2, 8.6 Hz, 1 H), 7.76 (d, J = 2.2 Hz, 1 H), 7.90 (s, 1 H), 11.3 (m, 2 H). MS(Cl): m/z 311.

EXAMPLE 162:

3-Chloro-4-hydroxy-benzenesulfonic acid [4-(4-trifluoromethoxybenzyloxy)-1-naphthylmethylene]hydrazide

The reaction mixture was stirred overnight, and filtered. The filtrate was concentrated under vacuo to give the crude product. Synthesis of alkylhydrazides according to the invention:

The alkylidene hydrazide derivatives given above can be reduced to the dihydroderivatives by the method given in Scheme V:

## SCHEME V

where A, R<sup>4</sup>, B, K, D, m and n are as defined for formula I.

The alkylhydrazide derivatives can be prepared by reduction (i.e. Lane, C.F.(1975), Synthesis, p.135) of the corresponding alkylidene hydrazides using a metal hydride, such as sodium borohydride or sodium cyanoborohydride. The alkylidene hydrazide derivative is treated with between 1-10 equivalents, preferentially 1-3 equivalents, of sodium cyanoborohydride in a solvent such as methyl alcohol, ethyl alcohol, isopropyl alcohol, tetrahydrofuran, dioxane, water or

a compatible mixture of two or more solvents. Optionally a small amount of an acid is used as  
5 a catalyst such as hydrochloric acid, trifluoroacetic acid, acetic acid, or sulfuric acid. The reactions are performed at 0°C to 60°C, preferably at 10°C to 30°C. When the reaction is complete as judged by HPLC or TLC (silica gel, 1% methanol in dichloromethane as eluent) the solvent(s) are removed and the residue is chromatographed on a silica gel column using 1% methanol in dichloromethane or chloroform as an eluent. The corresponding fractions are concentrated to give the desired product. Specific examples illustrating the preparation of alkylhydrazides according to the invention are provided below.

## EXAMPLE 167:

15 4-hydroxybenzoic acid (1-naphthylmethyl)hydrazide

4-Hydroxybenzoic acid (1-naphthylmethylene)hydrazide (100 mg, 0.34 mmol) was dissolved in methanol (10 mL) and treated with sodium cyanoborohydride (236 mg, 4.1 mmol) followed by two drops of trifluoroacetic acid. After stirring the reaction solution for three hours at room  
20 temperature, the solvent was evaporated in vacuo. The residue was introduced into a silica gel column and eluted with dichloromethane/methanol (99/1). Evaporation of the corresponding fractions in vacuo gave the title compound in 30% yield. MS (ESI) m/z 293 (M+H)<sup>+</sup>.

## EXAMPLE 173:

5 General procedure for synthesis of compounds of the general formula XI:

A and B are as defined for formula I and  $-NR^{5c}R^{5d}$  is

10 formula I or

-D' where -D' is defined as a subset of -D that contains a primary or secondary amine that can react as a nucleophile.

Step A: The reaction is known and is generally performed by stirring hydroxy benzaldehyde, hydroxy naphthaldehyde or the like together with a bromo acetic acid ester (either methyl, ethyl or other lower alkyl ester) in the presence of a base such as lithium, sodium, potassium or cesium carbonate in a solvent such as acetone, 2-methyl-3-pentanone, tetrahydrofuran, dioxane, DMSO, DMF, ethylene glycol, benzene, toluene or a mixture of the above solvents. The reactions are performed between 0°C to 130°C, preferably between 20°C to 100°C, most preferably at or about the reflux temperature of the solvent. The reactions are preferably conducted under an inert atmosphere such as N<sub>2</sub> or Ar. When the reaction is complete as judged by disappearance of the starting ester by TLC or HPLC, the solvent may be removed by concentration at atmospheric or reduced pressure. The product can be further purified by either recrystallization from a solvent such as ethyl alcohol, methyl alcohol, isopropyl alcohol, toluene, xylene, hexane, tetrahydrofuran, diethyl ether, dibutyl ether, water or a mixture of two or more of the above. Alternatively, the product can be purified by column chromatography using dichloromethane/methanol or chloroform/methanol or isopropyl alcohol as eluent.

15

Step B: The resulting derivative of acetic ester is then saponified using methods well-known to those skilled in the art such as dissolving the compound in an appropriate solvent such as a lower alcohol (e.g methanol, ethanol or isopropanol), DMF, dioxane or DMSO and adding an aqueous base like lithium, sodium or potassium hydroxide. The reactions are performed between 0°C to 130°C, preferably between 20°C to 100°C. When the reaction is complete as judged by disappearance of the starting ester by TLC or HPLC, the solvent may be removed by concentration at atmospheric or reduced pressure. The product can then be isolated by pouring the residue into water or cooled water and acidifying the mixture using an inorganic acid such as hydrochloric acid or sulfuric acid. The product can then be isolated either by filtration or by extraction using a solvent such as ethyl acetate, toluene, dichloromethane or diethylether and the solvent may then be removed by concentration at atmospheric or reduced pressure. The product can be further purified by either recrystallization from a solvent such as ethyl alcohol, methyl alcohol, isopropyl alcohol, toluene, xylene, hexane, tetrahydrofuran, diethyl ether, dibutyl ether, water or a mixture of two or more of the above. Alternatively, the product can be purified by column chromatography using dichloromethane/methanol or chloroform/methanol or isopropyl alcohol as eluent.

30

Step C: The resulting carbonyl compounds are treated with an acylhydrazide in a solvent. The solvent may be one of the following: ethyl alcohol, methyl alcohol, isopropyl alcohol, *tert*-butyl alcohol, dioxane, tetrahydrofuran, toluene, chlorobenzene, anisole, benzene, chloroform, dichloromethane, DMSO, acetic acid, water or a compatible mixture of two or more of the above solvents. A catalyst such as acetic acid can be added. A dehydrating reagent such as triethylorthoformate can also be added to the reaction mixture. The reaction is performed by stirring the reaction mixture preferably under an inert atmosphere of N<sub>2</sub> or Ar at temperatures between 0°C to 140°C, preferably between 10°C to 80°C. In many cases the product simply crystallizes out when the reaction is completed and is isolated by suction filtration. It can be further re-crystallized if necessary from a solvent such as the above described reaction solvents. The product can also be isolated by concentration of the reaction mixture in vacuo, followed by column chromatography on silica gel using a solvent system such as chloroform/methanol or dichloromethane/methanol or chloroform/ethyl acetate.

Step D: The resulting acid is then coupled to a primary or secondary amine using one of the methods well-known to those skilled in the art. This coupling can be performed using one of the standard amide or peptide synthesis procedures such as by generating an active ester, an anhydride or an acid halide that can then react with the amine to give a compound of formula XI. Step D can also be done combinatorially with a selected number of amines. The product can then be isolated either by filtration or by extraction using a solvent such as ethyl acetate, toluene, dichloromethane or diethylether and the solvent may then be removed by concentration at atmospheric or reduced pressure. The product can be further purified by either recrystallization from a solvent such as ethyl alcohol, methyl alcohol, isopropyl alcohol, toluene, xylene, hexane, tetrahydrofuran, diethyl ether, dibutyl ether, water or a mixture of two or more of the above. Alternatively, the product can be purified by column chromatography using dichloromethane/methanol or chloroform/methanol or isopropyl alcohol as eluent giving a compound of formula XI.

Specific examples illustrating the preparation of compounds of the general formula XI according to the invention are provided below.

## EXAMPLE 174:

2-{4-[(3-Chloro-4-hydroxy-benzoyl)hydrazonomethyl]naphthyl-1-yloxy}-N-(4-chloro-phenyl)acetamide

5 Step A: Hydroxynaphthaldehyde (10 g, 58 mmol), potassium carbonate (16 g, 110 mmol), and methyl bromoacetate (16 g, 100 mmol) were refluxed in acetone (120 mL) overnight. The reaction mixture was poured into an Erlenmeyer flask containing approximately 500 mL of ice chips. The mixture was stirred until all of the ice was melted. (4-Formylnaphth-1-yloxy)  
10 acetic acid methyl ester (13 g, 50 mmol) was filtered and dried in vacuo overnight.

$^1\text{H NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  3.86 (s, 3H), 4.93 (s, 2H), 6.80 (d, 1H), 7.61 (t, 1H), 7.72 (t, 1H), 7.90 (d, 1H), 8.42 (d, 1H), 9.29 (d, 1H), 10.22 (s, 1H).

15 Step B: The above ester (13 g, 50 mmol) was dissolved in methanol (100 mL) and 2 M NaOH (40 mL) was added. The reaction solution was stirred overnight and concentrated to approximately 100 mL under vacuo. The residue was poured into approximately 500 mL of ice chips and the mixture was acidified (by pH paper) with the addition of 3N HCl. The mixture was stirred until all of the ice was melted. (4-Formylnaphth-1-yloxy) acetic acid was  
20 filtered and washed with water.

Step C: To a solution of 3-chloro-4-hydroxybenzoic acid hydrazide (2g, 10.7 mmol) in DMSO (20 mL) was added the above (4-formylnaphth-1-yloxy) acetic acid (3g, 13 mmol) and a catalytic amount of acetic acid (10 drops). The solution was stirred overnight and diluted  
25 with ethyl acetate. The solution was washed with water (3x), brine, and dried over  $\text{MgSO}_4$ . The volume was reduced to approximately 100 mL and placed in an ice-bath. The resulting solid was filtered and washed with cold ethyl acetate to afford {4-[(3-chloro-4-hydroxy-benzoyl)hydrazonomethyl]naphth-1-yloxy} acetic acid.

$^1\text{H}$  NMR (DMSO- $d_6$ ):  $\delta$  4.91 (s, 2H), 6.95 (d, 1H), 7.02 (d, 1H), 7.55 (t, 1H), 7.64 (t, 1H), 7.74 (d, 1H), 7.92 (d, 1H), 8.27 (d, 1H), 8.90 (m, 2H), 10.92 (brd s, 1H), 11.63 (s, 1H), 13.14 (brd s, 1H).

5

Step D: To a solution of the hydrazone-carboxylic acid (50 mmol) in anhydrous DMSO was added a solution of carbonyldiimidazole (55 mmol) in anhydrous DMSO. After the evolution of gases ceased (approximately 3-4 minutes), the amine was added and the reaction mixture was stirred for 3 hours. The mixture was diluted with ethyl acetate and washed with water, 10 brine, and dried over magnesium sulfate. Evaporation of the solvent afforded the crude material, which was purified by reverse phase HPLC chromatography to give the title compound.

5

General procedure for synthesis of compounds of the general formula XII:

- 5 A and B are as defined for formula I and  $-NR^{5c}R^{5d}$  is

$-D'$  where  $-D'$  is defined as a subset of  $-D$  that contains a primary or secondary amine that can react as a nucleophile.

10

Step A: The carbonyl compounds are treated with an acylhydrazide in a solvent. The solvent may be one of the following: ethyl alcohol, methyl alcohol, isopropyl alcohol, *tert*-butyl alcohol, dioxane, tetrahydrofuran, toluene, chlorobenzene, anisole, benzene, chloroform, dichloromethane, DMSO, acetic acid, water or a compatible mixture of two or more of the above solvents. A catalyst such as acetic acid can be added. A dehydrating reagent such as triethylorthoformate can also be added to the reaction mixture. The reaction is performed by stirring the reaction mixture preferably under an inert atmosphere of  $N_2$  or Ar at temperatures between  $0^\circ C$  to  $140^\circ C$ , preferably between  $10^\circ C$  to  $80^\circ C$ . In many cases the product simply crystallizes out when the reaction is completed and is isolated by suction filtration. It can be further recrystallized if necessary from a solvent such as the above described reaction solvents. The product can also be isolated by concentration of the reaction mixture in vacuo, followed by column chromatography on silica gel using a solvent system such as chloroform/methanol or dichloromethane/methanol or chloroform/ethyl acetate.

20

Step B: The resulting acid is then coupled to a primary or secondary amine using one of the methods well-known to those skilled in the art. This coupling can be performed using one of the standard amide or peptide synthesis procedures such as by generating an active ester, an anhydride or an acid halide that can then react with the amine to give a compound of formula XII. Step B was also done combinatorially with a preactivated acid and a selection of amines. The product can then be isolated either by filtration or by extraction using a solvent such as ethyl acetate, toluene, dichloromethane or diethylether and the solvent may then be removed by concentration at atmospheric or reduced pressure. The product can be further purified by either recrystallization from a solvent such as ethyl alcohol, methyl alcohol, isopropyl alcohol, toluene, xylene, hexane, tetrahydrofuran, diethyl ether, dibutyl ether, water or a mixture of two or more of the above. Alternatively, the product can be purified by column chromatography using dichloromethane/methanol or chloroform/methanol or isopropyl alcohol as eluent giving a compound of formula XII.

Specific examples illustrating the preparation of compounds of the general formula XII according to the invention are provided below.

4-[3-Chloro-4-hydroxybenzoyl]-hydrazonomethyl]-1-naphthylacetamides and the various indolacetamides (step B):

General library production procedures :

To solutions of 4-[(3-chloro-4-hydroxybenzoyl)-hydrazonomethyl]naphthylacetic acid and the various indolylacetic acids in DMSO was added carbonyldiimidazole (1.2 eq). The solution was agitated for 5 minutes and diluted with DMSO to a concentration of 50 mM. The solution was then dispensed into 88 deep well plates containing solutions of amines in DMSO (50 mM). The plates were covered and agitated for 16 hours. The products were purified by HPLC.

General procedure for synthesis of compounds of the general formula XIII:

- 5 A and B are as defined for formula I and  $-NR^{5c}R^{5d}$  is

- 10 Step A: The carbonyl compounds are treated with an acylhydrazide in a solvent. The solvent may be one of the following: ethyl alcohol, methyl alcohol, isopropyl alcohol, *tert*-butyl alcohol, dioxane, tetrahydrofuran, toluene, chlorobenzene, anisole, benzene, chloroform, dichloromethane, DMSO, acetic acid, water or a compatible mixture of two or more of the above solvents. A catalyst such as acetic acid can be added. A dehydrating reagent such as triethylorthoformate can also be added to the reaction mixture. The reaction is performed by stirring the reaction mixture preferably under an inert atmosphere of  $N_2$  or Ar at temperatures between  $0^\circ C$  to  $140^\circ C$ , preferably between  $10^\circ C$  to  $80^\circ C$ . In many cases the product simply crystallizes out when the reaction is completed and is isolated by suction filtration. It can be further recrystallized if necessary from a solvent such as the above described reaction solvents. The product
- 15 can also be isolated by concentration of the reaction mixture in vacuo, followed by column chromatography on silica gel using a solvent system such as chloroform/methanol or dichloromethane/methanol or chloroform/ethyl acetate.
- 20

Step B: The resulting acid is then coupled to a primary or secondary amine using one of the methods well-known to those skilled in the art. This coupling can be performed using one of the standard amide or peptide synthesis procedures such as by generating an active ester, an anhydride or an acid halide that can then react with the amine to give a compound of formula XIII. The product can then be isolated either by filtration or by extraction using a solvent such as ethyl acetate, toluene, dichloromethane or diethylether and the solvent may then be removed by concentration at atmospheric or reduced pressure. The product can be further purified by either recrystallization from a solvent such as ethyl alcohol, methyl alcohol, isopropyl alcohol, toluene, xylene, hexane, tetrahydrofuran, diethyl ether, dibutyl ether, water or a mixture of two or more of the above. Alternatively, the product can be purified by column chromatography using dichloromethane/methanol or chloroform/methanol or isopropyl alcohol as eluent giving a compound of formula XIII.

Specific examples illustrating the preparation of compounds of the general formula XIII according to the invention are provided below.

5 General procedure for synthesis of compounds of the general formula XIV:

A and B are as defined for formula I and  $-NR^{5c}R^{5d}$  is

-D' where -D' is defined as a subset of -D that contains a primary or secondary amine that can react as a nucleophile.

- 15 Step A: The acid is coupled to a primary or secondary amine using one of the methods well-known to those skilled in the art. This coupling can be performed using one of the standard amide or peptide synthesis procedures such as by generating an active ester, an anhydride or

an acid halide that can then react with the amine to give a compound of formula XIV. The product can then be isolated either by filtration or by extraction using a solvent such as ethyl acetate, toluene, dichloromethane or diethylether and the solvent may then be removed by concentration at atmospheric or reduced pressure. The product can be further purified by either  
5 recrystallization from a solvent such as ethyl alcohol, methyl alcohol, isopropyl alcohol, toluene, xylene, hexane, tetrahydrofuran, diethyl ether, dibutyl ether, water or a mixture of two or more of the above. Alternatively, the product can be purified by column chromatography using dichloromethane/methanol or chloroform/methanol or isopropyl alcohol as eluent giving a compound of formula XIV.

10

Step B: The carbonyl compounds are then treated with an acylhydrazide in a solvent. The solvent may be one of the following: ethyl alcohol, methyl alcohol, isopropyl alcohol, tert-butyl alcohol, dioxane, tetrahydrofuran, toluene, chlorobenzene, anisole, benzene, chloroform, dichloromethane, DMSO, acetic acid, water or a compatible mixture of two or more of the above  
15 solvents. A catalyst such as acetic acid can be added. A dehydrating reagent such as triethylorthoformate can also be added to the reaction mixture. The reaction is performed by stirring the reaction mixture preferably under an inert atmosphere of N<sub>2</sub> or Ar at temperatures between 0°C to 140°C, preferably between 10°C to 80°C. In many cases the product simply crystallizes out when the reaction is completed and is isolated by suction filtration. It can be further recrystallized if necessary from a solvent such as the above described reaction solvents. The product  
20 can also be isolated by concentration of the reaction mixture in vacuo, followed by column chromatography on silica gel using a solvent system such as chloroform/methanol or dichloromethane/methanol or chloroform/ethyl acetate.

In many cases the product simply crystallizes out when the reaction is completed and is isolated by suction filtration. It can be further recrystallized if necessary from a solvent such as the above described reaction solvents. The product can also be isolated by concentration of the reaction mixture in vacuo, followed by column

Step B: The epoxide is then ring opened by a primary or secondary amine using one of the methods well-known to those skilled in the art to give a compound of formula XV. The solvent may be one of the following: ethyl alcohol, methyl alcohol, isopropyl alcohol, *tert*-butyl alcohol, dioxane, tetrahydrofuran, toluene, chlorobenzene, anisole, benzene, chloroform, dichloromethane, DMSO, DMF, NMP, water or a compatible mixture of two or more of the above solvents. The product can then be isolated either by filtration or by extraction using a solvent such as ethyl acetate, toluene, dichloromethane or diethylether and the solvent may then be removed by concentration at atmospheric or reduced pressure. The product can be further purified by either recrystallization from a solvent such as ethyl alcohol, methyl alcohol, isopropyl alcohol, toluene, xylene, hexane, tetrahydrofuran, diethyl ether, dibutyl ether, water or a mixture of two or more of the above. Alternatively, the product can be purified by column chromatography using dichloromethane/methanol or chloroform/methanol or isopropyl alcohol as eluent giving a compound of formula XV.

General procedure for the synthesis of substituted piperazine-aryl-aldehydes followed by hydrazone formation:

- 10 The substituted piperazine-aryl-aldehydes may be prepared by N-alkylation of the corresponding unsubstituted piperazine-aryl-aldehydes using various electrophilic alkylating agents that introduce the -(K)<sub>m</sub>-D moiety as defined above.

wherein Lx is a leaving group such as -Cl, -Br, -I, -OSO<sub>2</sub>CH<sub>3</sub>, -OSO<sub>2</sub>p-tolyl or -OSO<sub>2</sub>CF<sub>3</sub>; and A, R<sup>3a</sup>, R<sup>3b</sup>, R<sup>4a</sup>, R<sup>4b</sup>, a, b, c, d, f, p, q, D, M, R<sup>14</sup> and R<sup>15</sup> are as defined for formula I.

5

According to the above scheme the substituted piperazine-aryl-aldehydes can be prepared by stirring piperazinybenzaldehydes or piperazinylnaphthaldehydes in an organic solvent such as acetone, methylethyl ketone, dimethylformamide, DMSO, dioxane, tetrahydrofuran, toluene, ethylene glycol dimethyl ether, sulfolane, diethylether, water or a compatible mixture of two or more of the above solvents with an equimolar amount of an alkyl halide or an aryl-lower alkyl halide and in the presence of 1 to 15 equivalents (preferably 1 to 5 equivalents) of a base such as sodium hydride, potassium hydride, sodium or potassium methoxide, ethoxide or *tert*-butoxide, sodium, potassium or cesium carbonate, potassium or cesium fluoride, sodium or

10

potassium hydroxide or organic bases such as diisopropylethylamine, 2,4,6-collidine or benzyl-dimethyl- ammonium methoxide or hydroxide. The reaction can be performed at 0°C to 150°C, preferably at 20°C to 100°C and preferably in an inert atmosphere of N<sub>2</sub> or Ar. When the reaction is complete the mixture is filtered, concentrated in vacuo and the resulting product optio-

5 nally purified by column chromatography on silica gel using ethyl acetate/hexane as eluent. The compound can also (when appropriate) be purified by recrystallization from a suitable solvent such as ethyl alcohol, ethyl acetate, isopropyl alcohol, water, hexane, toluene or their compatible mixture. Specific examples illustrating the preparation of unsubstituted piperazine-aryl-aldehydes are provided below.

10

The following step, the hydrazone formation is described above in general and below in detail.

Preparation of 4-piperazinyl-2,5-dimethylbenzaldehyde:

15 4-(2,5-dimethylphenyl)-1-benzylpiperazine:

A solution of 2,5-dimethylphenylpiperazine (20 g, 105 mmol) was prepared in acetonitrile (300 mL) and cooled to 0 °C. Benzyl bromide (19 g, 111 mmol) was added and the reaction mixture was stirred for 15 minutes before potassium carbonate (16 g, 116 mmol) was added. After stirring the mixture for two hours, the acetonitrile was evaporated and the residue taken  
20 up in water and ethyl acetate. The organic layer was separated and washed with brine and dried over magnesium sulfate. The benzylated product was purified by silica gel column chromatography using gradient hexane/ethyl acetate (10/0 to 8/2). The product (21 g, 71%) was obtained as an oil.

25 <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.24 (s, 3H), 2.29 (s, 3H), 2.60 (brd s, 4H), 2.92 (brd s, 4H), 3.55 (s, 2H), 6.78 (m, 1H), 6.84 (s, 1H), 7.04 (m, 1H), 7.30 (m, 5H).

4-(2,5-dimethyl-4-formylphenyl)-1-benzylpiperazine:

The 4-(2,5-dimethylphenyl)-1-benzylpiperazine (10 g, 36 mmol) was dissolved in anhydrous  
30 DMF (30 mL, 390 mmol) and cooled to 0 °C. Fresh POCl<sub>3</sub> (70 mL, 750 mmol) was added drop wise with stirring. Once the addition was completed the dark mixture was warmed to 75 °C for five hours or until TLC analysis indicated the disappearance of the starting materi-

al. The excess phosphorous oxychloride was distilled off and the entire mixture was diluted with ethyl acetate and added slowly to 500 mL of ice-chips. The solution was neutralized and made basic with concentrated NaOH. The neutralization and basification must be done at low temperatures to avoid creating by-products. The formylated product was extracted with ethyl acetate (5x). The organic layer was washed with water (2x), brine, dried over magnesium sulfate and purified by silica gel column chromatography using gradient hexane/ethyl acetate (10/0 to 8/2). The product (9 g, 81%) was obtained as an oil.

<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.29 (s, 3H), 2.28 (s + t, 7H), 3.03 (t, 4H), 3.59 (s, 2H), 6.75 (s, 1H), 7.31 (m, 5H), 7.58 (s, 1H), 10.12 (s, 1H).

4-(2,5-dimethyl-4-formylphenyl)-1-(1-chloroethoxycarbonyl)piperazine:

The 4-(2,5-dimethyl-4-formylphenyl)-1-benzylpiperazine (9 g, 29 mmol) was dissolved in anhydrous 1,2-dichloroethane (100 mL) and 1-chloroethyl chloroformate (4.5 g, 31.5 mmol) was added. The solution was refluxed for 30 minutes or until TLC analysis indicated the disappearance of the starting material. The product was just slightly less polar than the starting material by TLC using hexane/EtOAc (3/1). Dichloroethane was evaporated and the residue was chromatographed using gradient hexane/EtOAc (10/0 to 8/2) to give the product (6 g, 64%) as an oil.

General procedure for the synthesis of N-substituted indole aldehydes followed by hydrazo-  
ne formation:

The N-substituted indole aldehydes may be prepared by N-alkylation of the corresponding unsubstituted indole aldehydes using various electrophilic alkylating agents that introduce the - (K)<sub>m</sub>-D moiety as defined above.

wherein Lx is a leaving group such as -Cl, -Br, -I, -OSO<sub>2</sub>CH<sub>3</sub>, -OSO<sub>2</sub>p-tolyl or -OSO<sub>2</sub>CF<sub>3</sub>; and A, R<sup>3a</sup>, R<sup>3b</sup>, R<sup>4a</sup>, R<sup>4b</sup>, a, b, c, d, f, p, q, D, M, R<sup>14</sup> and R<sup>15</sup> are as defined for formula I.

5

According to the above scheme the N-substituted indole aldehydes can be prepared by stirring formylindoles in an organic solvent such as acetone, methylethyl ketone, dimethylformamide, DMSO, dioxane, tetrahydrofuran, toluene, ethylene glycol dimethyl ether, sulfolane, diethylether, water or a compatible mixture of two or more of the above solvents with an equimolar amount of an alkyl halide or an aryl-lower alkyl halide and in the presence of 1 to 15 equivalents (preferably 1 to 5 equivalents) of a base such as sodium hydride, potassium hydride, sodium or potassium methoxide, ethoxide or *tert*-butoxide, sodium, potassium or cesium carbonate, potassium or cesium fluoride, sodium or potassium hydroxide or organic bases such as diisopropylethylamine, 2,4,6-collidine or benzyldimethylammonium methoxide or hydroxide. The reaction can be performed at 0°C to 150°C, preferably at 20°C to 100°C and

15

preferably in an inert atmosphere of N<sub>2</sub> or Ar. When the reaction is complete the mixture is filtered, concentrated in vacuo and the resulting product optionally purified by column chromatography on silica gel using ethyl acetate/hexane as eluent. The compound can also (when appropriate) be purified by recrystallization from a suitable solvent such as ethyl alcohol, ethyl acetate, isopropyl alcohol, water, hexane, toluene or their compatible mixture.

The following step, the hydrazone formation is described above in general and below in detail.

#### 10 Library Procedure for Indole Alkylation (Step A):

##### Preparation of the sodium salt of the indole:

Indole-3-carboxaldehyde (1.45 g) was dissolved into 8.6 mL of dry DMF in a dried and cooled 3 100 mL 3-necked roundbottom flask.

15 Evolution of large amounts of hydrogen gas occurs during this step. Care should be taken to keep the flow of inert gas steady and maintain adequate venting to accommodate the hydrogen gas evolution.

While maintaining a steady flow of nitrogen or argon through the 3-necked round bottomed  
20 flask, 1.1 equivalent of sodium hydride (0.27 g of dry 95% reagent) was transferred to the indole solution. The mixture was stirred for 15 minutes, while maintaining flow of inert gas. Proceeded promptly to the next step.

##### Preparation of the alkyl halide solutions:

25 Amber glass vials (for preparing stock solutions) were dried for at least four hours at 110 °C, then were allowed to cool under an argon atmosphere in a desiccator. Alkyl halides solutions (1.0 M) were prepared in anhydrous DMF in the dried vials. Each alkyl halide solution (100 µL) was added to its corresponding well of a deep-well plate (1 x 88 x 1 format).

Alkylation of the indole sodium salt:

100  $\mu$ L of the 1.0 M indole salt solution was quickly delivered to each alkyl halide in the deep-well plates. The plates were vortexed briefly to mix, then allowed to react for two hours.

**5 Library Procedure for Hydrazone Formation (Step B):**Acyl Hydrazone formation:

3-Chloro-4-hydroxybenzoic acid hydrazide (1.86 g) was dissolved in 5 mL of dry DMSO, followed by trifluoroacetic acid (0.77mL). The resulting solution was diluted to a final volume of 10.0 mL. 100  $\mu$ L of the 1.0 M acid hydrazide TFA salt solution was added to each well of the deep-well plate. The plate was vortexed for one minute to mix, then allowed to react for 30 minutes.

The products were purified by chromatography on silica gel with ethyl acetate/hexane eluent.

The following compounds were prepared:

Preparation of resin bound 3-chloro-4-hydroxybenzoic acid (3,4-dimethoxy-5-iodobenzylidene)hydrazide:

The above resin (Resin-[Building block 1]) (4 g) was suspended in DMF (50 mL) and 3,4-dimethoxy-5-iodobenzaldehyde (5.8 g) and triethyl orthoformate (25 mL) were added and the mixture was shaken for 16 hours at room temperature. The resin was successively washed with DMF (4 x 40 mL) and CH<sub>2</sub>Cl<sub>2</sub> (6 x 40 mL), and dried in vacuo at 50 °C  
5 for 16 hours to afford resin bound 3-chloro-4-hydroxybenzoic acid (3,4-dimethoxy-5-iodobenzylidene)hydrazide.

Preparation of resin bound trifluoromethanesulfonic acid 4-[(3-chloro-4-hydroxybenzoyl)-hydrazonomethyl]naphthalen-1-yl ester:

10 Similarly as described above but using trifluoromethanesulfonic acid 4-formyl-1-naphthyl ester instead of 3,4-dimethoxy-5-iodobenzaldehyde resin bound was trifluoromethanesulfonic acid 4-[(3-chloro-4-hydroxybenzoyl)hydrazonomethyl]naphthalen-1-yl ester obtained.

Preparation of resin bound 3-chloro-4-hydroxybenzoic acid (3-bromobenzylidene)hydrazide:

15 Similarly as described above but using 3-bromobenzaldehyde instead of 3,4-dimethoxy-5-iodobenzaldehyde resin bound 3-chloro-4-hydroxybenzoic acid (3-bromobenzylidene)hydrazide) was obtained.

Preparation of resin bound 3-chloro-4-hydroxybenzoic acid (4-bromobenzylidene)hydrazide:

20 Similarly as described above but using 4-bromobenzaldehyde instead of 3,4-dimethoxy-5-iodobenzaldehyde resin bound 3-chloro-4-hydroxybenzoic acid (4-bromobenzylidene)-hydrazide) was obtained.

## EXAMPLE 535:

3-Chloro-4-hydroxybenzoic acid [3-(1-aminocyclohexylethynyl)-4,5-dimethoxybenzylidene]-hydrazide

5

To the resin bound 3-chloro-4-hydroxybenzoic acid (3-bromobenzylidene)hydrazide (0.05 mmoles) was added copper (I) iodide (10 mg). Diisopropylethylamine (0.2 mL), a solution of triphenylphosphine in NMP (0.4 M, 0.5 mL), a solution of tetrabutylammonium chloride in water (0.66 M, 0.3 mL), a solution of palladium (II) acetate in NMP (0.16 M, 0.25 mL) and a solution of 1-ethynylcyclohexylamine ([Building block 3]) in NMP (1 M, 0.5 mL) were added successively, and the mixture was shaken at 90 °C for 15 hours. The resin was repeatedly washed with NMP (1.5 mL, 3 times), 50% water in DMF (1.5 mL, 3 times), NMP (1.5 mL, 2 times), 1% sodium diethylaminodithiocarbamate trihydrate (1.5 mL, 9 times), NMP (1.5 mL, 5 times), and CH<sub>2</sub>Cl<sub>2</sub> (1.5 mL, 6 times) for 2 minutes and filtered.

15

The compound was cleaved off the resin by shaking for 45 minutes at room temperature with a 50% solution of trifluoroacetic acid in CH<sub>2</sub>Cl<sub>2</sub> (1.5 mL). The mixture was filtered and the resin was extracted with CH<sub>2</sub>Cl<sub>2</sub> (0.5 mL). The combined CH<sub>2</sub>Cl<sub>2</sub> extracts were concentrated in vacuo. The residue was dissolved in a 1:1 mixture of methanol and CH<sub>2</sub>Cl<sub>2</sub> (1 mL) and concentrated in vacuo to give the title compound.

20

The final product obtained was characterized by analytical RP-HPLC (retention time) and by LC-MS (molecular mass).

25

The RP-HPLC analysis was performed on a Waters HPLC system consisting of Waters™ 600S Controller, Waters™ 996 Photodiode Array Detector, Waters™ 717 Autosampler, Waters™ 616 Pump, Waters™ 3 mm x 150 mm 3.5 μ C-18 Symmetry column and Millenium

QuickSet Control Ver. 2.15 using UV detection at 214 nm. A gradient of 5% to 90% acetonitrile/0.1% trifluoroacetic acid/water during 15 minutes at 1 mL/minute.

The LC-MS analysis was performed on a PE Sciex API 100 LC/MS System using a Waters™  
5 3 mm x 150 mm 3.5 µ C-18 Symmetry column and positive ionspray with a flow rate at 20 µL/minute.

General procedure for the preparation of Examples 615 to 694:

The following 80 compounds were prepared as single entities by parallel synthesis on a solid support. The attachment of [Building block 3] and cleavage from the resin were performed on an Advanced ChemTech Model 384 HTS.

5

The compounds were prepared according to the following equation:

- 10 and were simultaneously cleaved (and deprotected when protected) from the resin with 50% trifluoroacetic acid in dichloromethane to give the desired compounds as individual entities according to the following formula:

15

The starting resins, Resin-[Building block 1]-[Building block 2], were all prepared as described above.

- 20 The resin used was a polystyrene resin loaded with a Wang linker and the substitution capacity was 0.9 mmol/g.

All 80 compounds are based on attachment of [Building block 3] to Resin-[Building block 1]-[Building block 2] in a fully combinatorial way using a Suzuki reaction according to the following scheme.

where B-Lea is

or

wherein Lea is a leaving group and  $R^{14}$  and  $R^{15}$  are as defined for formula I.

The starting materials used were the same as those use in examples 535 to 614, i.e.

- 5 Resin-[Building block 1], [Building block 2] and [Building block 3] were the same as those used in examples 535 to 614, the only difference being the products in examples 615 to 694 are having double bonds as compared to the products in examples 535 to 614 having triple bonds.

## EXAMPLE 615:

3-Chloro-4-hydroxybenzoic acid {3-[2-(1-aminocyclohexyl)vinyl]-4,5-dimethoxybenzylidene}-hydrazide

Preparation of a 1,4-dioxane/THF solution of 1-(2-Benzo[1,3,2]dioxaborol-2-ylvinyl)cyclohexylamine:

To a solution of 1-ethynylcyclohexylamine ([Building block 3]) in 1,4-dioxane (1 M, 0.5 mL) was added a solution of catecholborane in THF (1 M, 0.5 mL) and the mixture was heated at 60 °C for 4 hours. The solution was cooled to room temperature and used directly in the Suzuki coupling reaction.

To the resin bound 3-chloro-4-hydroxybenzoic acid (3-bromobenzylidene)hydrazide (0.05 mmoles) was added a solution of cesium carbonate in water (1.25 M, 0.2 mL), a solution of triphenylphosphine and tetrabutylammonium chloride in NMP (both 0.4 M, 0.5 mL), a solution of palladium (II) acetate in NMP (0.16 M, 0.25 mL), was mixed and the solution of 1-(2-benzo[1,3,2]dioxaborol-2-ylvinyl)cyclohexylamine in 1,4-dioxane/THF (prepared as described above) was added and the mixture was shaken at 70 °C for 15 hours. The resin was repeatedly washed with NMP (1.5 mL, 3 times), 50% water in DMF (1.5 mL, 3 times), NMP (1.5 mL, 2 times), 1% sodium diethylaminodithiocarbamate trihydrate (1.5 mL, 9 times), NMP (1.5 mL, 5 times) and CH<sub>2</sub>Cl<sub>2</sub> (1.5 mL, 6 times) for 2 minutes and filtered.

The compound was cleaved off the resin by shaking for 45 minutes at room temperature with a 50% solution of trifluoroacetic acid in CH<sub>2</sub>Cl<sub>2</sub> (1.5 mL). The mixture was filtered and the resin was extracted with CH<sub>2</sub>Cl<sub>2</sub> (0.5 mL). The combined CH<sub>2</sub>Cl<sub>2</sub> extracts were concentrated

in vacuo. The residue was dissolved in a 1:1 mixture of methanol and  $\text{CH}_2\text{Cl}_2$  (1 mL) and concentrated in vacuo to give the title compound.

The final product obtained was characterized by analytical RP-HPLC (retention time) and by  
5 LC-MS (molecular mass).

The RP-HPLC analysis was performed on a Waters HPLC system consisting of Waters™ 600S Controller, Waters™ 996 Photodiode Array Detector, Waters™ 717 Autosampler, Waters™ 616 Pump, Waters™ 3 mm x 150 mm 3.5  $\mu$  C-18 Symmetry column and Millennium  
10 QuickSet Control Ver. 2.15 using UV detection at 214 nm. A gradient of 5% to 90% acetonitrile/0.1% trifluoroacetic acid/water at 15 minutes at 1 mL/minute.

The LC-MS analysis was performed on a PE Sciex API 100 LC/MS System using a Waters™ 3 mm x 150 mm 3.5  $\mu$  C-18 Symmetry column and positive ionspray with a flow rate at 20  $\mu$ L/minute.

General Procedure for Examples 695 to 701:

The compounds were prepared as single entities according to the following equation

and were simultaneously deprotected and cleaved from the resin with 50% trifluoroacetic acid in dichloromethane to give the desired compounds as individual entities according to the following formula

10

The following compounds were prepared as single entities by parallel synthesis on a solid support. Preparation of Resin-[Building block 1] was done manually, whereas the attachment  
15 of [Building block 2] and [Building block 3] and cleavage from the resin were performed on an Advanced ChemTech Model 384 HTS.

The starting resin, Resin-[Building block 1], was prepared as described above.

20 The resin used was a polystyrene resin with a Wang linker and the substitution capacity was 0.9 mmol/g.

All compounds are based on successive attachment of [Building block 2] and [Building block 3] to Resin-[Building block 1] in a combinatorial way using a nucleophilic substitution reaction  
25 according to the following formulae, which are included in the general formula II:

5 wherein  $R^{14}$ ,  $R^{15}$  are as defined for formula I and  $-\text{NR}^{5c}\text{R}^{5d}$  is

where  $R^{5a}$ ,  $R^{4a}$ ,  $R^{4b}$ ,  $c$ ,  $q$ ,  $d$ , and  $D$  are as defined for formula I or

-D' where -D' is defined as a subset of -D that contains a primary or secondary amine that can react as a nucleophile.

The following resin, here depicted as Resin-[Building block 1] was used:

This resin was prepared as described above.

Preparation of [Building block 2]:

## 10 Preparation of 4-(2-bromoethoxy)-2-methoxybenzaldehyde:

1,2-Dibromoethane (57 mL, 0.66 moles) was added to a mixture of 4-hydroxy-2-methoxybenzaldehyde (10 g, 66 mmoles) and potassium carbonate (45 g, 0.33 moles) in

DMF (130 ml) and the resulting mixture was stirred vigorously at room temperature for 16 hours. The mixture was poured into water (0.8 L) and extracted with ethyl acetate (3 x 300 mL). The combined organic phases were washed with saturated sodium chloride (400 mL), dried over  $\text{MgSO}_4$  and evaporated in vacuo to afford 17.4 g (99%) of 4-(2-bromoethoxy)-2-methoxybenzaldehyde, M.p. 78 - 79 °C.

Preparation of 4-(2-bromoethoxy)-3-methoxybenzaldehyde:

## EXAMPLE 792:

3-Amino-4-hydroxybenzoic acid {4-[2-(1,2,3,4-tetrahydro-isoquinolin-2-yl)ethoxy]-2-methoxybenzylidene}hydrazide

5

The above 4-(2-bromoethoxy)-2-methoxybenzaldehyde (16.8 g, 65 mmol) ([building block 2]) was dissolved in acetone (300 ml) and potassium carbonate (44.9 g, 0.33 mol), potassium iodide (2 g) were added followed by addition of 1,2,3,4-tetrahydroisoquinoline (9.07 g, 72 mmol). The resulting mixture was stirred vigorously at reflux temperature for 16 hours. After cooling, the mixture was filtered and the inorganic precipitate was washed with acetone (100 ml). The combined acetone filtrates were concentrated in vacuo. The residue was dissolved in ethyl acetate (50 ml) and washed with water (2 x 20 ml) saturated sodium chloride (20 ml), dried over  $\text{MgSO}_4$  and concentrated in vacuo. The residue (23 g) was purified by column chromatography on silica gel (400 g) eluting first with a mixture of ethyl acetate and heptane (1:1, 2 liters) then with a mixture of ethyl acetate and heptane (2:1, 5 liters) to afford 12 g (60%) of 4-[2-(1,2,3,4-tetrahydroisoquinolin-2-yl)ethoxy]-2-methoxybenzaldehyde as a solid. M.p.: 69 - 71 °C.

Calculated for  $\text{C}_{19}\text{H}_{21}\text{NO}_3 \cdot 0.25\text{H}_2\text{O}$ : C, 72.24%; H, 6.86%; N, 4.43%.

Methyl 3-amino-4-hydroxybenzoate (5.0 g, 30 mmol) was dissolved in ethanol (50 ml) and hydrazine hydrate (4.4 ml, 90 mmol) was added and the resulting mixture was heated at re-  
flux temperature for 16 hours. After cooling the mixture was filtered and solid was washed  
5 with ethanol to afford after drying 1.4 g (28%) of 3-amino-4-hydroxybenzoic acid hydrazide as a solid. M.p.: 242 - 243 °C.

Calculated for  $C_7H_9N_3O_2$ : C, 50.30%; H, 5.43%; N, 25.14%.

10 Found: C, 50.27%; H, 5.46%; N, 24.35%; C, 50.41%; H, 5.47%; N, 24.38%.

The above 3-amino-4-hydroxybenzoic acid hydrazide (50 mg, 0.3 mmol) and the above 4-[2-(1,2,3,4-tetrahydroisoquinolin-2-yl)ethoxy]-2-methoxybenzaldehyde (93 mg, 0.3 mmol) were dissolved in 2-propanol (4 ml) and the mixture was heated at reflux temperature for 16  
15 hours. The cooled mixture was filtered and the precipitate was washed with 2-propanol (2 x 4 ml) and dried by suction to afford 66 mg (48%) of the title compound as a solid. M.p.: 162 - 164 °C.

HPLC -MS (METHOD B):  $R_t$  = 6.50 minutes.  $m/z$  = 461.

3-Amino-4-hydroxybenzoic acid [4-(4-isopropylbenzyloxy)-3,5-dimethoxybenzylidene]-hydrazide

25

Syringaldehyde (4-hydroxy-3,5-dimethoxybenzaldehyde) (10.2 g, 55 mmol) was dissolved in DMF (45 ml), and 4-isopropylbenzylchloride (9.7 g, 55 mmol) and potassium carbonate (11.5 g) were added successively. The resulting mixture was heated at 60 °C for 16 hours. After cooling, the mixture was partitioned between water (150 ml) and ethyl acetate (3 x 100 ml).  
30 The combined organic extracts were washed with water (100 ml), saturated NaCl (100 ml),

dried ( $\text{MgSO}_4$ ), treated with activated carbon, filtered and concentrated in vacuo to afford 15 g (100%) of 4-(4-isopropylbenzyloxy)-3,5-dimethoxybenzaldehyde as an oil.

and were simultaneously deprotected (when required) and cleaved from the resin with 50% trifluoroacetic acid in dichloromethane to give the desired compounds as individual entities according to the following formula

10

The following compounds were prepared as single entities by parallel synthesis on a solid support. Preparation of Resin-[Building block 1] and attachment of [Building block 2] was  
15     done manually, whereas the attachment of [Building block 3] and cleavage from the resin were performed on an Advanced ChemTech Model 496 HTS in several runs.

The starting resin, Resin-[Building block 1], was prepared as described above.

20     The resin used was a polystyrene resin with a Wang linker and the substitution capacity was 0.9 mmol/g.

All compounds are based on successive attachment of [Building block 2] and [Building block 3] to Resin-[Building block 1] in a combinatorial way according to the following formulae,  
25     which are included in the general formula II:

wherein  $\text{R}^8$ ,  $\text{R}^9$ ,  $\text{R}^{14}$ ,  $\text{R}^{15}$  and

5 are as defined for formula I.

Step 1: Coupling of aldehyde [building block 2] to resin[buildingblock 1]

0.75 g resin (Wang resin loaded with 3-chloro-4-hydroxybenzoic acid hydrazide) was swelled in dimethylformamide (6 mL) for 30 min and drained. The aldehyde (4-formyl-3-methoxyphenyl)carbamic acid 9H-fluoren-9-ylmethyl ester, 0.5 g, 1.36 mmol) dissolved in  
5 dimethylformamide (3 mL) was added followed by addition of triethylorthoformate (1.5 mL). The mixture was shaken for 16 hr at 20°C and drained. The resin was washed with dimethylformamide (5x4 mL), dichloromethane (5x4 mL) and dimethylformamide (5x4 mL). The coupling of the aldehyde was repeated twice.

10 Step 2: Deprotection of aniline

The resin was swelled in dimethylformamide (5 mL) and piperidine added (1.25 mL). After shaking for 30 min, the resin was drained and washed with dimethylformamide (5x4 mL), N-methylpyrrolidinone (5x4 mL) and dimethylformamide (5x4 mL).

15 Step 3: Coupling of acid [building block 3] to resin[building block 1][building block 2]

The resin[building block 1][building block 2] was swelled in dimethylformamide (2.5 mL) and the acid (4-trifluoromethoxy)phenoxy acetic acid (0.64 g, 2.7 mmol) was added together with diisopropylcarbodiimide (0.21 mL). After 5 min of shaking dimethylaminopyridine (0.34 mL) was added and the mixture was shaken for 3 hr and drained. The resin was washed with di-  
20 methylformamide (5x4 mL), dichloromethane (5x4 mL) and dimethylformamide (5x4 mL). The coupling of the acid was repeated twice, but with 16 hr reaction time for the repetition.

Step 4: Cleavage from the resin

The resin was swelled in dichloromethane (2.5 mL) and trifluoroacetic acid (2.5 mL) was  
25 added. After shaking for 1 hr the resin was drained. The eluent was collected and concentrated in vacuo. The residue was crystallized from methanol to give 0.2 g of the title compound.

Further, a library of compounds of all the possible combinations of the above listed building blocks ([building block 1], [building block 2] and [building block 3]) was prepared in parallel as individual entities analogously to the previous example on an Advanced ChemTech Model  
5 384 HTS using the following ChemFile to control the operation of the synthesizer. The compounds are all expected to be present in the respective wells.

The four [building block 2] aldehydes, (4-Formyl-3-methoxyphenyl)carbamic acid 9H-fluoren-9-ylmethyl ester, (4-Formyl-2-methoxyphenyl)carbamic acid 9H-fluoren-9-ylmethyl ester, 3-  
10 (tert-Butyldimethylsilanyloxy)-4-formylphenyl)carbamic acid 9H-fluoren-9-ylmethyl ester and (5-Formyl-2-methoxyphenyl)carbamic acid 9H-fluoren-9-ylmethyl ester, were coupled to four individually batches of the resin bound 3-chloro-4-hydroxybenzoic acid hydrazide (resin-[building block 1]) using the same procedure as described for step 1 in the example above. Subsequently the Fmoc deprotection of the anilino group was carried out as described in  
15 step 2 in the example above.

The four different examples of resin[building block 1][building block 2] thus prepared were equally distributed in the wells in the synthesizer prior to the initialization of the device. The attachment of the array of [building block 3] mentioned above was carried out in a fully  
20 combinatorial way with the four types of resin[building block 1][building block 2] using the general procedure as described in step 3 in the example above. The final cleavage was performed using the same general procedure as described in step 4 in the example above. During this cleavage step deprotection of acid sensible protection groups was also taken place. These two steps 3 and 4 were carried out (in several runs) on an ACT 496 HTS  
25 automated synthesizer using the following ChemFile to control the device.

#### 5 HPLC Method 1.

The RP-HPLC analysis was performed using UV detection at 254 nm and a Merck Hibar LiChrosorb RP-18 (5  $\mu$ m) prepacked column (Cat. No. 50333), which was eluted at 1 mL/minute. Two solvent systems were used:

Solvent system I: 0.1% Trifluoroacetic acid in acetonitrile. Solvent system II: 0.1%

#### 10 Trifluoroacetic acid in water.

The column was equilibrated with a mixture composed of 20% of solvent system I and 80% of solvent system II. After injection of the sample a gradient of 20% to 80% of solvent system I in solvent system II was run over 30 minutes. The gradient was then extended to 100% of solvent system I over 5 minutes followed by isocratic elution with 100% of this system for 6  
15 minutes.

#### General Procedure for Examples 825 to 875:

The compounds were prepared as single entities according to the following equation

and were simultaneously deprotected and cleaved from the resin with 50% trifluoroacetic acid in dichloromethane to give the desired compounds as individual entities according to the  
25 following formula

[Building block 1]—[Building block 2]—[Building block 3].

5 The following compounds were prepared as single entities by parallel synthesis on a solid support. Preparation of Resin-[Building block 1]-[Building block 2] was done manually, whereas the attachment of [Building block 3] and cleavage from the resin were performed on an Advanced ChemTech Model 384 HTS.

10 The starting resin, Resin-[Building block 1], was prepared as described above.

The resin used was a polystyrene resin with a Wang linker and the substitution capacity was 0.9 mmol/g.

15 All compounds are based on successive attachment of [Building block 2] and [Building block 3] to Resin-[Building block 1] in a combinatorial way using a nucleophilic substitution reaction according to the following formulae, which are included in the general formula II:

Preparation of resin-[Building block 1]:

This resin was prepared as described above.

5 Preparation of 4-hydroxymethylnaphtaldehyde ([Building block 2]):

The preparation of this compound is described above.

Preparation of resin-[Building block 1]-[Building block 2]:

10

Preparation of resin bound 3-chloro-4-hydroxybenzoic acid (4-hydroxymethylnaphthylmethylene)hydrazide:

15

Resin-[Building block 1] (4 g) was suspended in DMF (40 mL) and was allowed to swell for 15 min. and then washed with DMF (2 x 40 mL), DCM (3 x 40 mL) and DMSO (2 x 40 mL). The solvent was removed by filtration. 1.488 g (8 mmol) 4-hydroxymethylnaphtaldehyde was dissolved in 40 mL DMSO and was added to the resin followed by 4 mL glacial acetic acid.

20 The suspension was shaken for 16 hours at 25 °C. The resin was successively washed with DMSO (2 x 40 mL), THF (3 x 40 mL), CH<sub>3</sub>OH (40 mL), CH<sub>2</sub>Cl<sub>2</sub> (40 mL), CH<sub>3</sub>OH (40 mL), CH<sub>2</sub>Cl<sub>2</sub> (40 mL) and dried *in vacuo* at 40 °C for 16 hours to afford resin bound 3-chloro-4-hydroxybenzoic acid (4-hydroxymethylnaphthylmethylene)hydrazide.

25 EXAMPLE 825:

3-chloro-4-hydroxybenzoic acid (4-(1H-1,2,4-Triazol-3-ylsulfanylmethyl)naphthylmethylene)hydrazide

The resin bound 3-chloro-4-hydroxybenzoic acid (4-hydroxymethylnaphthylmethylene)-hydrazide (resin-[Building block 1]-[Building block 2]) (2 g, ~ 2 mmoles) was swelled in  $\text{CH}_2\text{Cl}_2$  (20 mL) for 15 min, then washed twice with  $\text{CH}_2\text{Cl}_2$  (20 mL). 8 mL  $\text{CH}_2\text{Cl}_2$  and 8 mL diisopropylethylamine was subsequently added and the suspension was cooled to 0 °C. Methanesulfonylchloride (2 mL) was dissolved in  $\text{CH}_2\text{Cl}_2$  (6 mL) and added to the suspension. The mixture was allowed to react at 0 °C for 30 min, then at 25 °C for 1 hour. The resin was isolated by filtration and washed with  $\text{CH}_2\text{Cl}_2$  (2 x 20 mL) and N-methyl-2-pyrrolidone (2 x 20 mL). 1H-1,2,4-Triazole-3-thiol (0.8 g) and KI (0.4 g) was dissolved in a mixture of 10 mL N-methyl-2-pyrrolidone and 10 mL dimethylsulfoxide and was added to the resin. Then 4 mL diisopropylethylamine was added and the mixture was shaken at 25 °C for 2 days. The solvent was removed by suction and the resin was washed with N-methyl-2-pyrrolidone (3 x 20 mL) THF (3 x 20 mL),  $\text{CH}_3\text{OH}$  (20 mL),  $\text{CH}_2\text{Cl}_2$  (20 mL),  $\text{CH}_3\text{OH}$  (20 mL),  $\text{CH}_2\text{Cl}_2$  (4 x 20 mL). The compound was cleaved from the resin by shaking for 1 hour at 25 °C with a 50% solution of trifluoroacetic acid in  $\text{CH}_2\text{Cl}_2$  (20 mL). The mixture was filtered and the resin was extracted with acetonitrile (20 mL). The combined extracts were concentrated in vacuo. The residue was redissolved in a mixture of  $\text{CH}_3\text{OH}$  (10 mL) and acetonitrile (10 mL) and concentrated in vacuo. The residue was treated with  $\text{CH}_3\text{OH}$  (4 mL) at 25 °C providing an off-white precipitate which was isolated by filtration. The solid was washed with  $\text{CH}_3\text{OH}$  (3 x 2 mL) and dried in vacuo at 40 °C.

This afforded 275 mg of the title compound.

HPLC-MS (METHOD B):  $R_t$  = 2.48 min;  $m/z$  = 438 (M+1).

$^1\text{H-NMR}$  (300 MHz,  $\text{DMSO-d}_6$ )  $\delta$  = 4.9 (2H, s), 7.1 (1H, d), 7.5-7.9 (5H, m), 8.0 (1H, s), 8.25 (1H, d), 8.9 (1H, d), 9.1 (1H, s), 11.0 (1H, s), 11.8 (1H, s)

#### EXAMPLE 826:

3-Chloro-4-hydroxybenzoic acid (4-(isobutylaminomethyl)naphthylmethylene)hydrazide

The resin bound 3-chloro-4-hydroxybenzoic acid (4-hydroxymethylnaphthylmethylene)hydrazide (resin-[Building block 1]-[Building block 2]) (50 mg, ~ 0.05 mmoles) was swelled in  $\text{CH}_2\text{Cl}_2$  (1 mL) for 15 min, then washed with  $\text{CH}_2\text{Cl}_2$  (2 x 0.5 mL). 0.4 mL  $\text{CH}_2\text{Cl}_2$  and 0.4 mL diisopropylethylamine was subsequently added and the suspension was cooled to 0 °C. Methanesulfonylchloride (0.1 mL) was dissolved in  $\text{CH}_2\text{Cl}_2$  (0.3 mL) and added to the suspension. The mixture was allowed to react at 0 °C for 30 min, then at 25 °C for 1 hour. The resin was isolated by filtration and washed with  $\text{CH}_2\text{Cl}_2$  (2 x 0.5 mL) and DMSO (0.5 mL). DMSO (0.5 mL) was added followed by 50  $\mu\text{L}$  isobutylamine and 100  $\mu\text{L}$  diisopropylethylamine. The mixture was shaken at 25 °C for 16 hours, filtered and washed successively with DMSO (2 x 0.5 mL), THF (3 x 0.5 mL),  $\text{CH}_3\text{OH}$  (0.5 mL),  $\text{CH}_2\text{Cl}_2$  (0.5 mL),  $\text{CH}_3\text{OH}$  (0.5 mL),  $\text{CH}_2\text{Cl}_2$  (4 x 0.5 mL). The mixture was filtered and the resin was extracted with acetonitrile (1 mL). The combined extracts were concentrated *in vacuo*. The residue was redissolved in a mixture of  $\text{CH}_3\text{OH}$  (0.5 mL) and acetonitrile (0.5 mL) and concentrated *in vacuo* to give the title compound.

HPLC-MS (METHOD B):  $R_t$  = 4.20 min;  $m/z$  = 410 ( $M+1$ )

General Procedure for Examples 876 to 877:

The compounds were prepared as single entities according to the following equation

20

and were simultaneously deprotected and cleaved from the resin with 50% trifluoroacetic acid in dichloromethane to give the desired compounds as individual entities according to the following formula

25

[Building block 1]—[Building block 2]—[Building block 3]—[Building block 4].

5 The following compounds were prepared as single entities by parallel synthesis on a solid support. Preparation of Resin-[Building block 1]-[Building block 2] was done manually, whereas the attachment of [Building block 3], attachment of [Building block 4] and cleavage from the resin were performed on an Advanced ChemTech Model 384 HTS.

10 The starting resin, Resin-[Building block 1], was prepared as described above.

The resin used was a polystyrene resin with a Wang linker and the substitution capacity was 0.9 mmol/g.

15 All compounds are based on successive attachment of [Building block 2] and [Building block 3] to Resin-[Building block 1] in a combinatorial way using a nucleophilic substitution reaction followed by an acylation reaction attaching [Building block 4] according to the following formulae, which are included in the general formula II:

## EXAMPLE 876:

N-{4-[(3-Chloro-4-hydroxybenzoyl)-hydrazonomethyl]naphthylmethyl}-N-isobutylprolinamide

15

The resin bound 3-chloro-4-hydroxybenzoic acid (4-hydroxymethylnaphthyl-methylene)hydrazide (resin-[Building block 1]-[Building block 2]) (50 mg, ~ 50  $\mu$ moles) was swelled in  $\text{CH}_2\text{Cl}_2$  (0.5 mL) for 15 min, then washed twice with  $\text{CH}_2\text{Cl}_2$  (0.5 mL). 0.4 mL  $\text{CH}_2\text{Cl}_2$  and 0.4 mL diisopropylethylamine were subsequently added and the suspension was cooled to 0  $^\circ\text{C}$ . Methanesulfonylchloride (0.1 mL) was dissolved in  $\text{CH}_2\text{Cl}_2$  (0.3 mL) and added to the suspension. The mixture was allowed to react at 0  $^\circ\text{C}$  for 30 min, then at 25  $^\circ\text{C}$  for 1 hour. The resin was isolated by filtration and washed with  $\text{CH}_2\text{Cl}_2$  (2 x 0.5 mL) and DMSO (0.5 mL). 0.5 mL DMSO was added to the resin followed by isobutylamine (50  $\mu\text{L}$ )

20

and diisopropylethylamine (100  $\mu$ L). The mixture was shaken at 25 °C for 16 hours. The solvent was removed by suction and the resin was washed with DMSO (2 x 0.5 mL) and THF (3 x 0.5 mL). To a solution of *N-tert*-butoxycarbonyl-proline (46 mg, 0.21 mmol) in THF (0.5 mL) was added diisopropylcarbodiimide (16  $\mu$ L, 0.2 mmol). This solution was allowed to react at 25 °C for 10 minutes and then added to the resin. The suspension was shaken at 25 °C for 16 hours after which the resin was isolated by suction and washed with THF (3 x 0.5 mL), DMF (3 x 0.5 mL) THF (3 x 0.5 mL), CH<sub>3</sub>OH (0.5 mL), CH<sub>2</sub>Cl<sub>2</sub> (0.5 mL), CH<sub>3</sub>OH (0.5 mL), CH<sub>2</sub>Cl<sub>2</sub> (4 x 0.5 mL). The compound was cleaved from the resin by shaking for 1 hour at 25 °C with a 50% solution of trifluoroacetic acid in CH<sub>2</sub>Cl<sub>2</sub> (1 mL). The mixture was filtered and the resin was extracted with acetonitrile (1 mL). The combined extracts were concentrated in vacuo. The residue was redissolved in a mixture of CH<sub>3</sub>OH (0.5 mL) and acetonitrile (0.5 mL) and concentrated in vacuo to give the title compound.

HPLC-MS (METHOD B):  $R_t$  = 3.90 min;  $m/z$  = 507 (M+1).

#### EXAMPLE 877:

3-Chloro-4-hydroxybenzoic acid ((4-(4-trifluoromethoxybenzylamino)methyl)naphthyl-methylene)hydrazide

20

Resin bound 3-chloro-4-hydroxybenzoic acid (4-hydroxymethylnaphthylmethylene)hydrazide (resin-[building block 1]-[building block 2]) (50 mg) was swelled in a 1:1 mixture of CH<sub>2</sub>Cl<sub>2</sub> and N-methyl-2-pyrrolidone (0.5 mL) for 15 minutes and then washed with CH<sub>2</sub>Cl<sub>2</sub> (3 x 0.5 mL). 800  $\mu$ L of a 1:1 mixture of CH<sub>2</sub>Cl<sub>2</sub> and diisopropylethylamine was added to the resin which subsequently was cooled to -3 °C. A solution of 100  $\mu$ L methanesulfonylchloride dissolved in 300  $\mu$ L was added and allowed to react at -3 °C for 30 minutes then at 25 °C for 1 hour. Filtration of the resin was followed by washing with CH<sub>2</sub>Cl<sub>2</sub> (2 x 1 mL) and N-methyl-2-pyrrolidone (2 x 0.5 mL). 600  $\mu$ L of a solution of 4-trifluoromethoxybenzylamine (45.8 mg, 0.24 mmol, 0.4M) and KI (10 mg, 0.06 mmol, 0.1M) in N-methyl-2-pyrrolidone (0.5 mL) and

The resin was isolated by filtration and washed successively with N-methyl-2-pyrrolidone (5 x 0.5 mL) and THF (3 x 0.5 mL). 600 µL of a solution of acetic anhydride (120 µL, 130 mg, 1.27 mmol) in THF (480 µL) was added to the resin. The mixture was allowed to react at 25 °C for 16 hr. The resin was filtered and washed successively with THF (2 x 0.8 mL), CH<sub>3</sub>OH (0.8 mL), CH<sub>2</sub>Cl<sub>2</sub> (0.8 mL), CH<sub>3</sub>OH (0.8 mL) and CH<sub>2</sub>Cl<sub>2</sub> (3 x 0.8 mL). ## EXAMPLE 882:

N-[4-[3-chloro-4-hydroxybenzoyl]-hydrazonemethyl]-1-naphthyl)methyl iso-propyl amide

5

Preparation of *N*-4-Formylnaphthylmethyl isopropyl amide:

- A mixture of 4-bromomethyl-1-naphthaldehyde ethyleneacetal (447 mg, 1.52 mmol) and  $\text{NaN}_3$  (221 mg, 3.4 mmol) in 10 mL DMF was warmed up to 100 °C and stirred for 30 min. Solution turned orange. The reaction was filtered and the clear solution was concentrated to 391 mg of yellow oil. This oil (249 mg) together with triphenylphosphine (260 mg, 0.99 mmol) was dissolved in 10 mL of THF. The reaction mixture was left overnight followed by the addition of water. Ninhydrin test revealed the formation of an amine. This amine was extracted into ethyl acetate layer, dried to give an oil. PCT/DK 98/00287

## Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 36-39  
because they relate to subject matter not required to be searched by this Authority, namely:  
See PCT Rule 39.1(iv): Methods for treatment of the human or animal body by surgery or therapy, as well as diagnostic methods.
2. ☒ Claims Nos.: 1-17, 22-35 and 40-43  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:  
  
Claims 1-17, 22-35 and 40-43 are searched incompletely since these claims are so broadly formulated. It is not possible to carry out a meaningful search into the state of the art on the basis of these claims. For this reason the search has been limited to the examples and claims 18-21.
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.  
☐ No protest accompanied the payment of additional search fees.
